Sure, here's a professional summary of your task:

You are tasked with automating a process using Microsoft Powershell. The goal is to extract device information using the Microsoft Graph Powershell Module command 'Get-MgDevice'. This data needs to be stored in a MySQL database table named 'cmdb'.

However, there is a challenge: the fields in the 'cmdb' table do not align with the data fields returned by the 'Get-MgDevice' command. Therefore, an important part of your task is to map the fields correctly from the Powershell command output to the MySQL table.

This task involves knowledge of Powershell scripting, Microsoft Graph API, and MySQL database management. It's a complex task that requires careful planning and execution to ensure data integrity and automation efficiency.
